

A decorative graphic on the left side of the slide. It consists of a blue parallelogram and a light green parallelogram, both tilted at an angle. The blue shape is in the foreground, and the green shape is partially behind it. They are set against a dark blue background with diagonal stripes of varying shades.

Recursion

What is a Recursive Function?

- By definition, a recursive function is one that calls itself
- Can be thought of as taking a big problem and reducing it to smaller chunks
- When you cannot reduce anymore, then you combine the solutions
 - When you can't combine anymore, it's often called a *base case*

```
1  def factorial(num):  
2      # factorial code here  
3      factorial_minus_one = factorial(num - 1)  
4      # factorial code here
```

Template for a Recursive Function

- Check for base cases first
- Then, reduce the problem as many times as you can
- Combine all of the reduced results with your arg
- Return combined results
- Note: usually only 1 base case and only 1 reduction/ combination

```
1 def recursion(arg):
2     if arg is at base case 1:
3         return base case
4     ...
5     if arg is at base case n:
6         return base case
7
8     reduced_result_1 = recursion(reduction 1 on arg)
9     ...
10    reduced_result_m = recursion(reduction m on arg)
11
12    combine arg and reduced_result_1 and ... and reduced_result_m
13    return combined arg and reduced_results
14
```

Live Coding: Recursive Sum Function

```
1  def recursive_sum(num):
2      # Base cases - 2 in this case
3      if num == 0:
4          return 0
5      if num < 0:
6          return 0
7
8      # Reduction - only 1 in this case
9      reduced_result_1 = recursive_sum(num - 1)
10
11     # Combining reduced result and num
12     combined_value = reduced_result_1 + num
13
14     return combined_value
```

Recursive sum walkthrough

$\text{recursive_sum}(5) \Rightarrow 0 + 1 + 2 + 3 + 4 + 5$ $\text{recursive_sum}(4) + 5 \Rightarrow 10 + 5; \text{return } 15$

$\text{recursive_sum}(4) \Rightarrow 0 + 1 + 2 + 3 + 4$ $\text{recursive_sum}(3) + 4 \Rightarrow 6 + 4; \text{return } 10$

$\text{recursive_sum}(3) \Rightarrow 0 + 1 + 2 + 3$ $\text{recursive_sum}(2) + 3 \Rightarrow 3 + 3; \text{return } 6$

$\text{recursive_sum}(2) \Rightarrow 0 + 1 + 2$ $\text{recursive_sum}(1) + 2 \Rightarrow 1 + 2; \text{return } 3$

$\text{recursive_sum}(1) \Rightarrow 0 + 1$ $\text{recursive_sum}(0) + 1 \Rightarrow 0 + 1; \text{return } 1$

$\text{recursive_sum}(0) \Rightarrow 0$ Problem is at its simplest; return base case (0)

A decorative graphic on the left side of the slide. It consists of a blue parallelogram and a light green parallelogram, both tilted at an angle. The blue shape is in the foreground, and the green shape is partially behind it. They are set against a dark blue background with subtle diagonal lines.

Large Group Project 1: Factorial

Recursive Data Structures

- By definition, a recursive data structure is one that uses itself in its member variables
- Usually, can be thought of as “pointing to” another version of itself
- Linked lists, trees, and graphs can all be implemented using a recursive data structure
- None typically indicates the end of the data structure, if needed

```
1 class Node:
2     def __init__(self, value, next_node):
3         self.value = value          # Value of item in List
4         self.next_node = next_node  # Must be a Node, or None if the end of list
5
6 linked_list = Node(1, Node(2, Node(3, Node(4, None))))
```

Recursive Data Structure (cont.)

```
linked_list = Node(1, Node(2, Node(3, Node(4, None))))
```

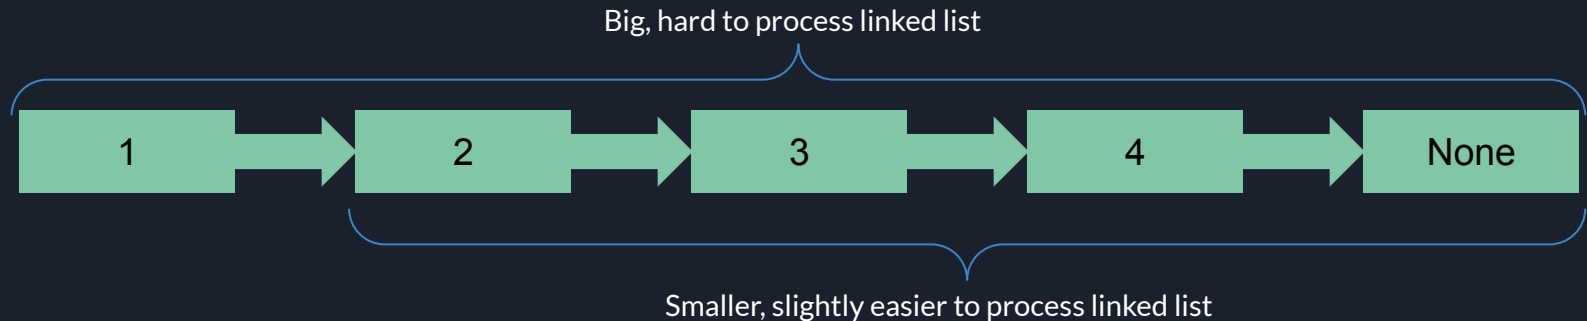

Live Coding: Summing a Linked List

```
1 class Node:
2     def __init__(self, value, next_node):
3         self.value = value          # Value of item in List
4         self.next_node = next_node  # Must be a Node, or None if the end of List
5
6 def sum_linked_list(linked_list):
7     # Base Case
8     if linked_list == None:
9         return 0
10
11    # Reduction
12    reduced_linked_list_sum = sum_linked_list(linked_list.next_node)
13    # Combining reduced result and current value
14    combined_value = reduced_linked_list_sum + linked_list.value
15
16    # Return combined values
17    return combined_value
```

Recursive Functions and Data Structures

- Recursive functions work really well with recursive data structures
- Recursive data structures by their own definition can easily be split up into smaller data structures
- In our linked list example, a large linked list was split into many smaller linked lists until you got to the smallest linked list possible: an empty list represented by None
